

# Phosphorus Mitigation Project

(SFF 404964 – commencing 1<sup>st</sup> July 2016)

**Advancing on-farm phosphorus loss mitigation in conjunction with applied research on a new mitigation tool - the Detainment Bund**

## **Funders:**

Sustainable Farming Fund (50%), Co-Funders (50%)

DairyNZ, BOPRC, Beef + Lamb NZ, Ballance Agri-Nutrients, Environment Canterbury, Deer Industry NZ. > \$ 400K

In-Kind support > \$ 200K

## **Governance Group of Farmers:**

Executive Committee; L McKenzie (Chair), N Saville-Wood (Treasurer), M Birchall, M pacey, B Heard, J Paterson (Project Manager).

Committee; R Moore, Jamie Paterson, Hera Naera, T Cairns, J Ford.

## **Science Advisory Team:**

D Hamilton, C Tanner, L Condron, D Horne, G Lucci, D Clarke, V Fulton, J Peryer-Fursdon

## **Applied Researcher:**

To be confirmed

“..... anthropogenic phosphorus is predominantly particulate...”

“Management of anthropogenic particulate phosphorus loads should be a high priority for reduction as they will be most amenable to management. Sub-catchment particulate phosphorus loads are most appropriately addressed by **land-use best practice** (McDowell 2010), improved **stormwater detention** (Nix et al. 1988) and **erosion control** (Stutter et al. 2008)”

G Tempero et. al 2015 – ERI Report 66

**Table 1. Summary of annual phosphorus loading to Lake Rotorua, including estimated percentage range of anthropogenic total phosphorus reduction needed to achieve a TLI target of 4.2 (in parentheses).**

|                               | Annual loading t P y <sup>-1</sup> |               |          |
|-------------------------------|------------------------------------|---------------|----------|
|                               | Total                              | Anthropogenic | Baseline |
| Dissolved reactive phosphorus | 27.7                               | 6.1           | 21.6     |
| Particulate phosphorus        | 21.0                               | 17.3          | 3.7      |
| Total phosphorus              | 48.7                               | 23.4 (43-64%) | 25.3     |

# A train of P-loss Prevention and Mitigation tools

## Cost / Benefit Summary

**Table 2.** Summary of efficacy and cost of P mitigation strategies

| Strategy                                    |               | Effectiveness<br>(%) | Cost<br>(NZD \$/kg P conserved)    |
|---|---------------|----------------------|------------------------------------|
| Optimum soil test P                         | management    | 5-20 <sup>1</sup>    | highly cost-effective <sup>1</sup> |
| Low solubility P fertilizer                 |               | 0-20                 | 0-30                               |
| Stream fencing                              |               | 10-30                | 5-65                               |
| Greater effluent pond storage               |               | 10-30                | 30                                 |
| Low rate effluent application to land       |               | 10-30                | 45                                 |
| Tile drain amendments                       | amendment     | 50                   | 25-100                             |
| Restricted grazing of cropland              |               | 30-50                | 150-250                            |
| Alum to pasture                             |               | 5-30                 | 150->500                           |
| Alum to grazed cropland                     | edge of field | 30                   | 160-260                            |
| Grass buffer strips                         |               | 0-20                 | >250                               |
| Sorbents in and near streams                |               | 20                   | 350                                |
| Retention dams water recycling <sup>2</sup> |               | 10-80                | >500                               |
| Constructed wetlands <sup>3</sup>           |               | -426-77              | >500                               |
| Natural seepage wetlands <sup>3</sup>       |               | <10%                 | >500                               |

<sup>1</sup> depends on existing soil test P concentration, but no cost if already in excess of optimum.

<sup>2</sup> upper bound only applicable to retention dams combined with water recycling

<sup>3</sup> potential for wetlands to act as a source of P renders upper estimates for cost infinite.

From AgResearch  
R. McDowell, 2010

# Accountable structure for GMPs integral with new Phosphorus Mitigation Project

- **GMPs – top of the list for both P-mitigation effectiveness and cost effectiveness**
- **An effective on-farm Environment Management System (EMS) can assure good uptake of GMPs**
- **Two NZ Ag Industry's have EMS type templates for managing the effective uptake of GMPs:**
  - ❖ **DairyNZ – Sustainable Milk Plans (SMP)**
  - ❖ **Beef + Lamb NZ – Land and Environment Plans (LEP) which also covers Deer Farmers**

Sediment and nutrient highway  
flow over usually dry paddocks

# Ephemeral streams (overland flow)

The predominant pathway for P and sediment export from pastoral farmland to freshwaters

# DBs occupy productive pasture paddocks “they are not a farm dam”

Kaharoa 2012, a DB empty in the LHS pic and still flooding in on the RHS pic

<http://researchcommons.waikato.ac.nz/handle/10289/7993>

**The performance of Detainment Bunds (DBs) for attenuating phosphorus and sediment loss from pastoral farmland**

[Clarke, Dylan T.](#)

2013

[Master of Science \(MSc\)](#)

University of Waikato

- Provided proof of concept
- “not sufficient for reporting purposes”

# Particulate N

- In some cases, reductions in Particulate Nitrogen concentrations of outflow water were observed
- E.g. a 42% reduction in PN concentration over 20 hours
- Attributed to a recently grazed winter forage crop

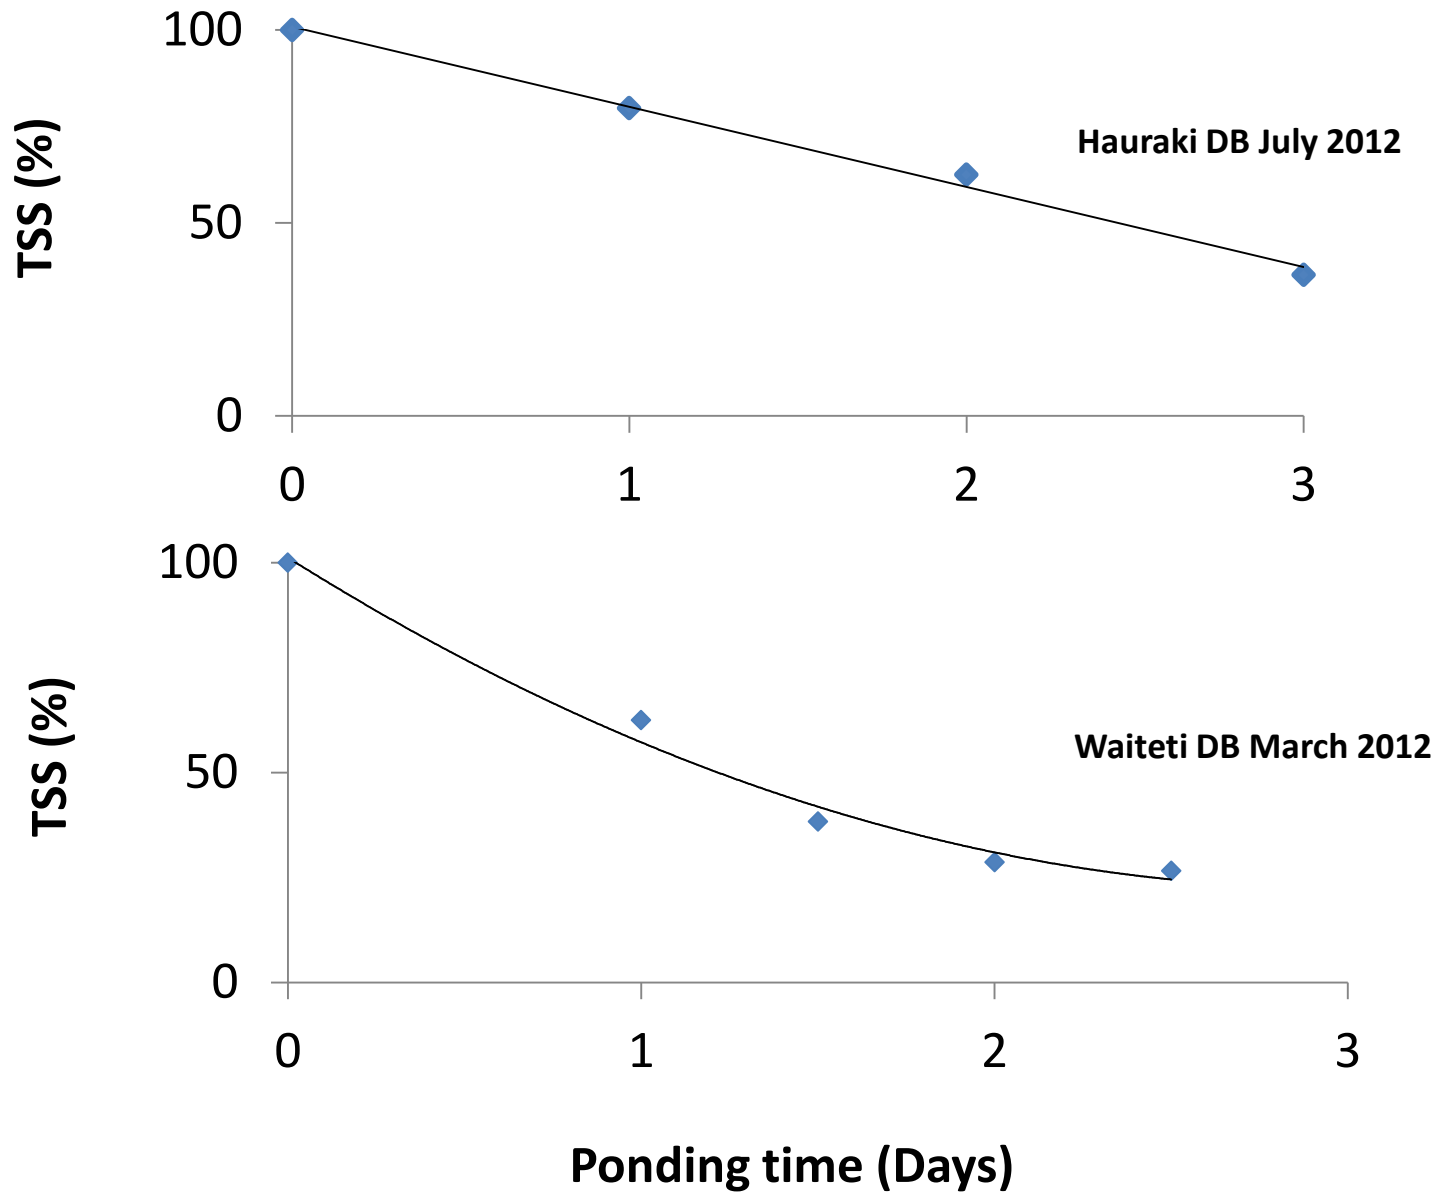

# Sediment deposited

2.7 t sediment deposited  
extreme case

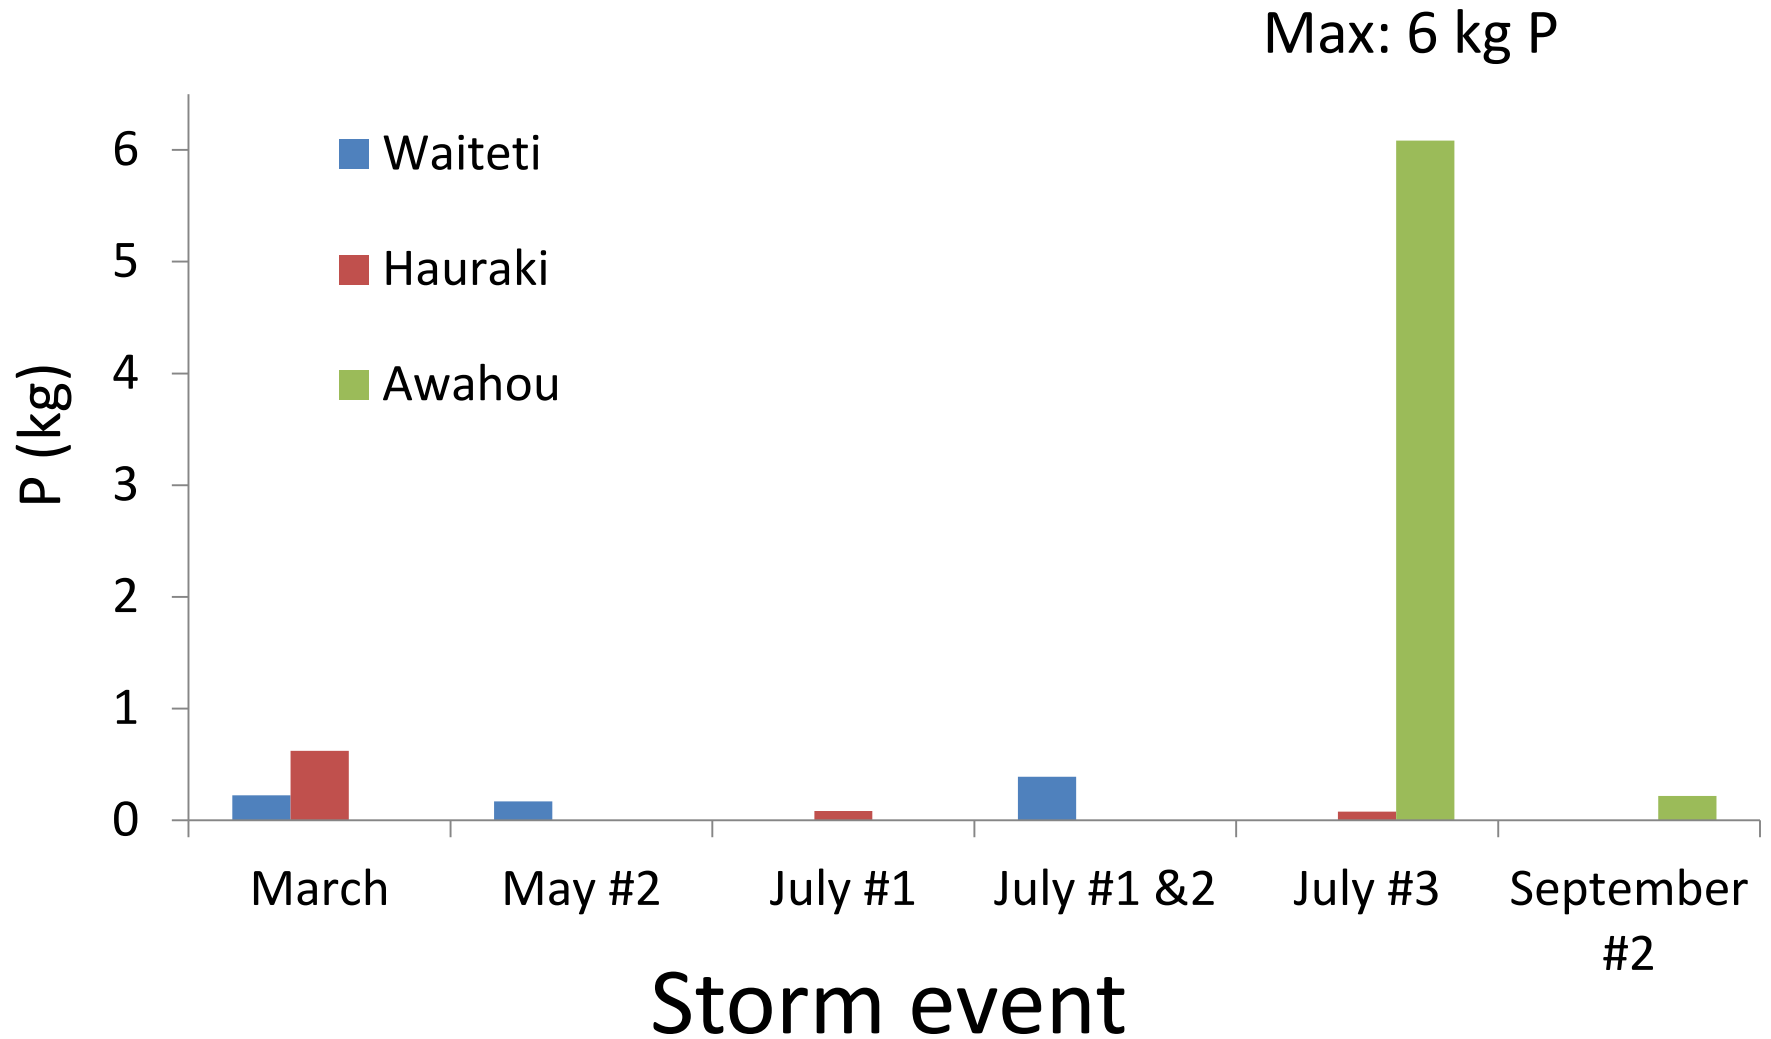

# Total Suspended Sediment (TSS)

# P retained

# Integrating DBs into farm systems

**Aim to maintain the productive potential of ponding area**

**Optimal ponding time** is a compromise between:

- maximising water treatment
- maintaining pasture quality
- 3 days inundation has been tolerated by the Land Owner participants

# Phosphorus Mitigation Project

- Aims to shift the knowledge from 'qualitative' to 'quantitative' – credible for reporting.
- Learn how to best drive DBs (pre storm plugging, 120:1, 3 days ponding, post storm care, etc.)
- Emphasis on catchment BMPs (monitored via EMS's)
- MSc - 5 data sets (1yr x 5 events x 3 sites)
- PhD – 90 data sets (3yr x 5 events x 6 sites)
- Trial sites in 3 different catchments (select 6 from 20)
- Different farm types – Dairy, drystock, Deer ? tbc.

# Phosphorus Mitigation Project

- Full hydrological analysis of events at DBs
- Science Advisory Team – finalizing methodology
- More automated monitoring / sampling
- Land owner practices / status of covers - also monitored per event
- Near source dosing of flocculants (2 options)
- Additional features:
  - monitoring of e-coli (tbc)
  - subject to SAT and \$

Thanks again to the researchers and particularly the farmers for rising to the challenge of integrating DBs into their farming systems

Funding for the Phosphorus Mitigation Project approved by SFF 14/04/2016  
Co-funders confirmed (others pending):

- Bay of Plenty Regional Council
- DairyNZ
- Ballance Agri-Nutrients
- Beef + Lamb
- DINZ
- Ecan

Start date 1<sup>st</sup> July 2016
